This report is one of a series of reports prepared by the United States Department of the Interior, Geological Survey, Water Resources Division, which presents basic data on wells obtained from reconnaissance surveys of desert areas. These investigations are conducted by the Geological Survey under a cooperative agreement whereby funds are furnished equally by the United States and the State of California. The reports in this Bulletin No. 91 series are being published by the Department of Water Resources in order to make sufficient copies available for use by all interested agencies and the public at large. Earlier reports of this series are:

- Bulletin No. 91-1: Data on Wells in the West Part of the Middle Mojave Valley Area, San Bernardino County, California
- 91-2: Data on Water Wells and Springs in the Yucca Valley-Twenty-nine Palms Area, San Bernardino and Riverside Counties, California
- 91-3: Data on Water Wells in the Eastern Part of the Middle Mojave Valley Area, San Bernardino County, California
- 91-4: Data on Water Wells in the Willow Springs, Gloster, and Chaffee Areas, Kern County, California
- 91-5: Data on Water Wells in the Dale Valley Area, San Bernardino and Riverside Counties, California
- 91-6: Data on Wells in the Edwards Air Force Base Area, California
- 91-7: Data on Water Wells and Springs in the Chuckwalla Valley Area, Riverside County, California
- 91-8: Data on Water Wells and Springs in the Rice and Vidal Valley Areas, Riverside and San Bernardino Counties, California
- 91-9: Data on Water Wells in Indian Wells Valley Area, Inyo, Kern, and San Bernardino Counties, California
- 91-10: Data on Wells and Springs in the Lower Mojave Valley Area, San Bernardino County, California
- 91-11: Data on Water Wells in the Western Part of the Antelope Valley Area, Los Angeles and Kern Counties, California

Mr. William E. Warne, Director
Department of Water Resources
State of California--Resources Agency
Post Office Box 388
Sacramento, California, 95814

Dear Mr. Warne:

We are pleased to transmit for publication by the Department of Water Resources the U.S. Geological Survey report, "Data on Water Wells in the Eastern Part of the Antelope Valley Area, Los Angeles County, California," by J. H. Koehler.

This report, one of a series for the Mojave Desert region, was prepared by the Garden Grove subdistrict office of the Geological Survey in accordance with the cooperative agreement between the State of California and the Geological Survey. It tabulates all available data on wells in the eastern part of the Antelope Valley area and shows reconnaissance geology with special reference to the water-yielding deposits.

Sincerely yours,

Walter Hofmann
District Chief

DATA ON WATER WELLS IN THE EASTERN PART OF THE ANTELOPE VALLEY AREA,
LOS ANGELES COUNTY, CALIFORNIA

By J. H. Koehler

PURPOSE AND SCOPE OF THE WORK AND REPORT

The data presented in this report were collected by the U.S. Geological Survey as a phase of the investigation of water wells and general hydrologic conditions throughout much of the desert region of southern California. The study was made in cooperation with the California Department of Water Resources.

The desert regions of California are characteristically regions of nearly barren mountain ranges and isolated hills surrounding broad valleys that are underlain by alluvial deposits derived from the mountains and hills. The valley areas generally contain ground water that has a wide range in chemical quality, but much of the water can be, and has been, developed for beneficial use.

The general objective of the cooperative investigation is to collect and tabulate all available hydrologic data for the individual desert basins in order to provide public agencies and the general public with data for planning water utilization and development work and for use in the overall ground-water investigation of the area.

Accordingly, the scope of the work includes: (1) A brief reconnaissance of major geologic features to determine the extent and general character of the deposits that contain the ground-water bodies; (2) a field examination of almost all the water wells in the area to determine the location of wells in relation to geographic and cultural features and the public-land net and to record well depths and sizes, types and capacities of pumping equipment, uses of the water, and other pertinent information available at the well site; (3) measurement of the depth to the water surface below an established and described measuring point at or near the land surface; (4) selection of representative wells to be measured periodically in order to detect and record changes of water level; and (5) collection and tabulation of well records, including well logs, water-level measurements, chemical analyses, and pumping-test data.

The work has been done by the U.S. Geological Survey, under the general supervision of Walter Hofmann, district chief in charge of water-resources investigations in California, and under the immediate supervision of L. C. Dutcher, chief of the Garden Grove subdistrict office. The fieldwork was carried on intermittently between July 1963 and May 1964 from the Garden Grove subdistrict office of the Water Resources Division.

LOCATION AND GENERAL FEATURES OF THE AREA

The eastern part of the Antelope Valley area, as described in this report (fig. 1), covers about 450 square miles, approximately between long 117°40' and 118°15' W. and lat 34°20' and 34°45' N. The boundaries of the area are: The Western Antelope Valley area of Moyle (1965) on the west; the Edwards Air Force Base area of Dutcher and others (1962) on the north; the Los Angeles and San Bernardino County line on the east; and the San Andreas fault zone on the southwest. Access to the area is provided by State Highway 14, formerly U.S. Highway 6, and other paved and unpaved roads.

The two principal towns within the area are Lancaster and Palmdale. The smaller towns of Quartz Hill, Littlerock, Pearblossom, Antelope Center, Valyermo, Pearland, and Llano are also within the area.

The base map (fig. 2) has been compiled from all or parts of the following U.S. Geological Survey topographic quadrangle maps: Lancaster, Shadow Mountains, Acton, Valyermo, and San Antonio, at a scale of 1:62,500; Alpine Butte, Littlerock, and Lovejoy Buttes, at a scale of 1:24,000.

The area is characterized by gently sloping alluvial plains and fans that extend into the area from the northern slopes of the San Gabriel Mountains which are south of the area. Lovejoy Buttes, Alpine Butte, and Black Butte rise above the alluvial plain to form the major topographic relief.

PREVIOUS WORK AND ACKNOWLEDGMENTS

Data on ground water in the eastern part of the Antelope Valley area are contained in several U.S. Geological Survey water-supply papers and in reports by the California Department of Water Resources (table 7).

The California Department of Water Resources and the Los Angeles County Flood Control District supplied pertinent open-file information.

The geology, as shown in figure 2, is generalized after published mapping by Dibblee (1954a, 1954b, and 1955) in the Alpine Butte quadrangle, the Shadow Mountains quadrangle, and the Lancaster quadrangle; and after unpublished mapping by Dibblee in the eastern San Gabriel Mountains and Cajon Pass area and the Valyermo area.

The cooperation and assistance listed above is gratefully acknowledged, as is the assistance given by the many ranchers, well owners, drillers, and others who contributed materially to the completeness of the data presented in this report.

GEOLOGIC AND HYDROLOGIC FEATURES OF THE AREA

Geologic Units and Their Water-Bearing Character

The geologic formations of Antelope Valley are divided into two main groups, the consolidated rocks and the unconsolidated deposits. The formations within these groups have dissimilar water-bearing characteristics, but, in general, the unconsolidated younger deposits of Quaternary age are more porous and permeable than the consolidated older rocks of pre-Tertiary and Tertiary age. The unconsolidated deposits generally underlie the valleys and contain most of the ground water stored in the area. The consolidated rocks form the mountains and hills, surround the valley area, underlie the unconsolidated deposits, and form the sides and bottom of the ground-water basin. The consolidated rocks, for all practical purposes, are impermeable, but are important because in the mountains and hills they receive the major part of the precipitation within the drainage area. It is the runoff from the mountains and hills that contributes the major part of the recharge to the ground-water body contained in the unconsolidated deposits. In the following paragraphs the geologic units, shown in figure 2, are described from oldest to youngest with special reference to their water-bearing characteristics.

The oldest formation in the area is the basement complex which consists of undifferentiated quartz monzonite, granite, gneiss, schist, and other igneous and metamorphic rocks, all of pre-Tertiary age. The basement complex is generally impermeable, except for joints and weathered zones that yield water to small springs.

The Martinez Formation of Noble (1954), of Paleocene age, is composed of shale, arkosic sandstone, and conglomerate. These rocks have a low permeability and yield little or no water to wells.

The Vasquez Formation, of Oligocene and probably early Miocene age, is composed of lava flows of pyroxene basalt, andesite, dacite, and rhyolite; and interbedded tuff, ash, and breccia. This formation crops out in two localities within the mapped area, south of Palmdale and south of Littlerock, and in each case lies along the south side of the San Andreas fault zone. These rocks are low in permeability and yield almost no water to wells.

The Punchbowl Formation, of late Miocene and early Pliocene age (T. W. Dibblee, Jr., oral commun., 1965), is composed of sandstone and conglomerate and yields little or no water to wells.

The Anaverde Formation, of early to middle Pliocene age, is composed of moderately consolidated arkosic sandstone and conglomerate, with thin beds of shale along the trace of the San Andreas fault. Faulting has displaced and divided the formation into numerous blocks or compartments. The rocks of this formation have a low permeability and yield small amounts of water to wells.

The unnamed sandstone, probably of Pliocene age, is composed of arkosic sandstone, conglomerate, and reddish siltstone. These rocks crop out in the southeast part of the mapped area, north of the San Andreas fault. They yield little or no water to wells.

The older fan deposits, of Pleistocene age, are composed generally of unconsolidated coarse gravel, mainly of granitic and gneissic detritus. Where these deposits are saturated they yield water to wells.

The older alluvium, of Pleistocene age, underlies most of the valley floor. It consists mainly of poorly sorted gravel, sand, silt, and clay. The older alluvium is oxidized and generally unconsolidated, but in some places it is slightly cemented. This formation is porous and permeable, extends below the water table, yields water freely to wells, and is the most important water-bearing unit in the area.

The younger alluvium, of Recent age, consists of unconsolidated sand with small amounts of gravel, silt, and clay. Deposition is presently taking place on the lower parts of the fans and over the lowland plain. The alluvium is permeable and, where saturated, will yield water to wells. However, in this area, it is nearly everywhere above the water table and therefore is not an important water-bearing unit, although it transmits precipitation and water from the intermittent streams to the ground-water body.

The dune sand, of Recent age, is composed of actively drifting fine to medium sand. The dune sand is everywhere above the water table, but in some places it contains small quantities of perched water.

The playa deposits, of Recent age, are composed of silt, clay, and sandy clay with small amounts of soluble salts. The playa deposits are generally above the water table and are of little or no importance with regard to ground water in the area.

Recharge and Discharge of Ground Water

Recharge to the ground-water bodies of the area occurs by direct infiltration of rain, from subsurface flow from adjoining areas, and from percolation of infrequent runoff in streams that drain the San Gabriel Mountains. Rainfall on the valley floor averages less than 8 inches annually, but in the surrounding mountains may reach a maximum of about 20 inches per year. The average annual recharge is less than the pumpage; consequently, in excessively pumped areas the water levels have declined. The gradient of the water table, as shown by water-level measurements, suggests that runoff from the San Gabriel Mountains supplies most of the recharge and that the ground water, in general, moves from south to north.

WELL-NUMBERING SYSTEM

The well-numbering system used in the eastern part of the Antelope Valley area has been used by the Geological Survey in California since 1940. The system has been adopted by the California Department of Water Resources and by the California Water Quality Control Board for use throughout the state.

Wells are assigned numbers according to their location in the rectangular system for the subdivision of public land. For example, in the number 7N/12W-34E1, the part of the number preceding the slash indicates the township (T. 7 N.), the part between the slash and the hyphen is the range (R. 12 W.), the number between the hyphen and the letter indicates the section (sec. 34), and the letter indicates the 40-acre subdivision of the section, as shown in the accompanying diagram.

D	C	B	A
E	F	G	H
M	L	K	J
N	P	Q	R

Within the 40-acre tract the wells are numbered serially as indicated by the final digit. Thus, well 7N/12W-34E1 is the first well to be listed in the SW¹/₄NW¹/₄ sec. 34, San Bernardino base line and meridian.

The letter Z, substituted for the letter designating the 40-acre tract, indicates that the well was plotted from unverified descriptions; the described locations of such wells were visited, but no evidence of a well could be found.

There are a few exceptions to this system of numbering wells according to their position in the 40-acre subdivision of the section. These are wells, usually having long periods of record, which were assigned numbers based on earlier, less accurate maps. During this investigation, these wells have been plotted at the correct location on the map, but the old number has been retained to facilitate use of the older records for the well.

APPENDIX A

TABLE 1. DESCRIPTIONS OF WELLS IN THE EASTERN PART
OF THE ANTELOPE VALLEY AREA, CALIFORNIA

Table 1.--Descriptions of wells in the eastern part of the Antelope Valley area, California

State well number: The number given is the number assigned to the well according to the method described in the section on the well-numbering system.

Other numbers and source of data: The source of data on each line is indicated by the following

symbols: B Smith (1959); D driller; DWR California Department of Water Resources;
FC Los Angeles County Flood Control District; GS U.S. Geological Survey; J Johnson (1911);
M Munger Oilgram; O owner; P pump service contractor; SCE Southern California Edison Co.;
T Thompson (1929); WRB California Water Rights Board. A number following the letter symbol
is the well number used by that person or agency. For well numbers assigned by the California
Department of Water Resources prior to adoption of the uniform state well-numbering system, the
township and range numbers and letters are omitted and the section and letter are given.

Date of observation: The date given is the date on which the well was visited.

Owner or user: The name given is that of the owner or user of the well on the date indicated. If
data are given for more than one date, previous owners may be listed.

Year completed: The completion date was obtained from the driller's log or reported by the owner
or others.

Depth: Depths of wells given in whole feet were reported by owners, drillers or others; where a logged well (table 4) was not cased for the full drilled depth, the reported depth is the depth of the bottom of the casing; depths given in feet and tenths of a foot were measured below land-surface datum by the Geological Survey or others as indicated.

Type and diameter: The type of well construction is indicated by the following symbols: A auger; C cable tool; D dug by hand; R rotary. The number following the letter is the diameter of the casing or pit, in inches. For an unsymmetrically dug well, only the maximum dimension is given. The symbol N indicates no casing visible at surface.

Type of pump and power: The pump type or method of lift is indicated as follows: A air lift; C centrifugal; J jet; L lift; N none; S submersible; Si siphon; T turbine. The type of power is indicated as follows: D diesel; E electric motor of undetermined horsepower (a number in this column indicates the rated horsepower of an electric motor); G gasoline engine; Gr gravity; H hand operated; N none; S steam engine; W windmill.

Yield: The yield or output of the pump, in gallons per minute, as reported by the Southern California Edison Co., owners, or drillers. It is not necessarily the maximum capacity of the well or installed pump.

Use: The use of the well is indicated by the following symbols: Dm domestic; Ds destroyed or dry; In industrial; Ir irrigation; O observation; Ps public supply; RR railroad; S stock; T test hole; Un unused.

Measuring point: The point from which water-level measurements are made is described as follows:

Bhc bottom of hole in casing; Bpb bottom of pump base; Hpb hole in pump base; Ls land surface; Na no access either to or into the well; Tap top of access pipe; Tc top of casing; Tcc top of casing cover; Tf top of flange; Tpb top of pump base. The distance of the measuring point above or below (-) land-surface datum is given in feet, tenths of a foot, and sometimes hundredths of a foot. All measurements listed in table 1 are from the same measuring point unless otherwise indicated in the column for measuring points.

Altitude: The figure given indicates the altitude, in feet above mean sea level, of the land-surface datum. Land-surface datum is an arbitrary plane that closely approximates land surface at the time of the first measurement and is the fixed plane of reference for all subsequent measurements. Altitudes, given in whole feet, were interpolated from Geological Survey topographic maps having 5-, 25-, and 40-foot contour intervals. Altitudes, given to the nearest tenth or hundredth of a foot, were taken from Los Angeles County Flood Control District data.

Water level: Measured depths to water are given in feet, tenths of a foot, and hundredths of a foot, or feet and tenths of a foot; reported or approximate depths to water are given in whole feet. The distance between land-surface datum and the measuring point has been subtracted from or added to the measured water level. Thus, all water levels are referenced to land-surface datum. Water levels with a plus (+) symbol are those above land-surface datum.

Other data: C chemical analyses of water are given in table 5; E electric log of well in files of the Geological Survey; L driller's log of well is given in table 4; P pumping test data are given in table 3; W additional water-level measurements are given in table 2.

- Well being pumped.
- Well pumped recently.
- Nearly well being pumped.
- Some rain in at bottom of well.
- Tape smeared.
- Driller at bottom of well.
- Obstruction at approximately 425 feet, no water to here.
- Obstruction at bottom above static water level.
- Obstruction or bottom at 400 feet, no water to this depth.
- Depth of well and water level greater than 615 feet.
- Measured with an electric sounder.
- Drilled to this depth, hole then filled.
- Measurement considered questionable by observer.
- Artesian flow.
- Original well drilled to 17 feet in 1911, deepened to 100 feet in 1941.
- See driller's log.
- Owner reports well is dry part of the year.
- Tape smeared start at 270 feet, solid smear started at 37 feet.
- Original well deepened.
- Well at end of horizontal adit on side of hill.
- Measured with an air-line gage.

APPENDIX B

TABLE 2. RECORDS OF WATER LEVELS IN WELLS

Table 2.--Records of water levels in wells

Table 2 includes records of water-level measurements made in wells where five or more measurements have been made; if fewer than five measurements were made, the records are given in table 1.

Depths of wells, given in whole feet, were reported by owners, drillers, or others; depths given in feet and tenths of a foot were measured below land-surface datum by the Geological Survey or others.

Records of water-level measurements furnished by agencies other than the Geological Survey are indicated by the following symbols:

D driller; DWR California Department of Water Resources; FC Los Angeles County Flood Control District; LAC Los Angeles County Engineers; O owner; P pump service contractor; PID Palmdale Irrigation District; SCE Southern California Edison Co.; T Thompson (1929); WRB California Water Rights Board.

Altitudes are for the land-surface datum at the well and are in feet above mean sea level; the altitudes that are given in feet and tenths of a foot have been established by agencies other than the Geological Survey. Altitudes, given in whole feet, were interpolated from Geological Survey topographic maps having 5-, 25-, and 40-foot contour intervals.

Water-level measurements are given in feet, tenths of a foot, and hundredths of a foot, or feet and tenths of a foot; reported or approximate depths to water are given in whole feet. The distance between land-surface datum and the measuring point has been subtracted from or added to the measured water level. Thus, all water levels are referenced to land-surface datum.

- a. Well being pumped.
- b. Well pumped recently.
- c. Nearby well being pumped.
- f. Dry.
- k. Measurement from recorder chart.
- m. Obstruction or bottom above water surface.
- p. Measurement considered questionable by observer.
- q. Artesian flow.
- r. Well has been filled in.
- s. Some moisture at bottom well.
- t. Tape smears, measurement is questionable.
- u. Measured with an electric sounder.
- v. Measured with an air-line gage.
- w. Driller encountered first water at this depth.

APPENDIX C

TABLE 3. PUMPING TESTS OF WELLS

Table 3.--Pumping tests of wells

Source of data: D driller; DGT Thompson (1929); DWR California Department of Water Resources; FC Los Angeles County Flood Control District; O owner; P pump service contractor; SCE Southern California Edison Co.; and WRB California Water Rights Board.

Depth of well: The depth shown is the depth of the well, in feet, as shown in table 1, and is not necessarily the depth on the date of the pumping test.

Pumping rate: The pumping rate, reported in gallons per minute (gpm), does not necessarily indicate the maximum capacity of the well, but is the rate at which the well was pumped at the time of the test.

Static water level: The static, or standing, water level is the reported depth to water at the time of the test. In some cases, the static water level may be higher than that listed because the standing water-level measurement was made minutes after completion of the test and reflects the water level during recovery, not the static level. Because the reported static water level is not always precise, the drawdown and specific-capacity values may not be exact.

Drawdown: The drawdown is the difference, in feet, between the static water level and the pumping water level.

Specific capacity: The specific capacity is a measure of the physical condition of the well and the aquifer or aquifers which it penetrates. A well with a large specific capacity is capable of a greater yield than a well with a small specific capacity. Specific capacity is obtained by dividing the pumping rate, in gallons per minute, by the drawdown, in feet, after an extended period of pumping.

Well number	Source of data	Depth of well (feet)	Date tested	Pumping rate (gpm)	Static water level (feet)	Drawdown (feet)	Specific capacity (gpm/ft of dd)

APPENDIX D

TABLE 4. DRILLERS' LOGS OF WELLS

Table 4.--Drillers' logs of wells

	Thickness (feet)	Depth (feet)
4N/8W-7K1. Richard A. Carlyon, formerly E. A. Eberle. Deepened from 160 to 477 ft by V. A. Reed in 1950. 12-inch casing 0-473 ft, perforated 296-448 ft. Altitude about 4,400 ft.		
No record -----	160	160
Clay, sandy, hard, packed -----	23	183
Clay, sandy, soft -----	19	202
Clay, brown, sticky, with hard layers -----	46	248
Clay, brown, with hard layers -----	66	314
Gravel, "dry" -----	2	316
Clay and gravel -----	2	318
Gravel, "dry" -----	2	320
Clay and gravel -----	13	333
Gravel, "dirty," "dry" -----	6	339
Clay, sandy -----	37	376
Clay, brown, hard, "jointed" -----	18	394
Clay, soft, water-bearing -----	2	396
Clay, brown, hard, "jointed" -----	1	397
Clay with hard layers and some sand -----	11	408
Clay, "jointed" -----	25	433
Gravel, water-bearing -----	8	441
Clay and gravel -----	4	445
Sand, hard -----	16	461
Sand and gravel -----	10	471
Sand and clay, hard, packed -----	5	476
Sand and clay, sticky, hard, packed -----	1	477

4N/8W-30R1. All Nations Camp. Drilled by V. A. Reed in 1950. 10-inch casing 0-64 ft, perforated 12-42 ft. Altitude about 5,580 ft.

Conglomerate -----	15	15
Boulders -----	2	17
Conglomerate -----	13	30
Boulders -----	3	33
Conglomerate -----	1	34
Boulders -----	22	56
Conglomerate -----	8	64

Thickness (feet)	Depth (feet)	Thickness (feet)	Depth (feet)
---------------------	-----------------	---------------------	-----------------

4N/9W-6G1. Crystalline Estates. Drilled by Garbier & Bridges in 1951. 20-inch casing 0-33 ft, 12-inch casing 33-95 ft. Altitude about 3,493 ft.

Sand, gravel, and boulders -----	28	28	Rock, moderately hard -----	14	72
Rock, fractured, hard -----	28	56	Rock, fractured -----	4	76
Rock, fractured -----	2	58	Rock, hard -----	19	95

4N/9W-8M1. U.S. Forest Service. Drilled by J. L. Clugage in 1961. 8-inch casing 0-150 ft, perforated 0-150 ft. Altitude about 3,730 ft.

Gravel and boulders --	12	12	Sand, fine, and yellow clay with some gravel -----	123	152
Gravel, boulders, and yellow clay -----	17	29			

4N/9W-9E1. Crane. Drilled in 1946. 8-inch casing 0-140 ft, perforated 60-140 ft. Altitude about 3,795 ft.

Boulders and gravel --	76	76	Clay, boulders, and gravel -----	64	140
------------------------	----	----	-------------------------------------	----	-----

4N/9W-9M1. Mountain Brook Ranch. Drilled by J. L. Clugage in 1958. 14-inch casing 0-150 ft, perforated 75-140 ft. Altitude about 3,800 ft.

Boulders, sand, and gravel -----	75	75	Clay, yellow-gray, sticky -----	12	141
Gravel, water-bearing-	19	94	Granite -----	9	150
Clay, yellow-gray, sticky, soft -----	35	129			

Thickness (feet)	Depth (feet)	Thickness (feet)	Depth (feet)
---------------------	-----------------	---------------------	-----------------

4N/9W-9N1. Mountain Brook Ranch. formerly the Wilson Ranch.
 Drilled by J. L. Clugage in 1946 to 140 ft, deepened to 201 ft in 1956.
 16-inch casing 0-140 ft, perforated 60-140 ft (casing diameter and
 perforated interval unknown for well between 140 and 201 ft). Altitude
 about 3,845 ft.

Boulders and gravel --	76	76	Clay, sandy -----	61	201
Clay, boulders, and gravel -----	64	140			

4N/9W-9N2. Mountain Brook Ranch. Drilled by J. L. Clugage in
 1950. 14-inch casing 0-209 ft, no casing 209-218 ft, perforated
 75-180 ft. Altitude about 3,845 ft.

Soil -----	6	6	Sand, clean, and gravel -----	2	128
Boulders and gravel --	76	82	Clay, yellow, and sand -----	10	138
Sand and gravel -----	4	86	Sand and gravel -----	8	146
Clay, gray, and gravel -----	4	90	Clay, yellow, hard, and sand -----	42	188
Clay, yellow, and sand -----	21	111	Clay, yellow, and sand, cemented ----	30	218
Sand, clean, and gravel -----	9	120			
Clay, yellow, and sand -----	6	126			

4N/9W-9N3. Mountain Brook Ranch. Drilled by J. L. Clugage in
 1957. 14-inch casing 0-157 ft, no casing 157-205 ft. Altitude about
 3,834 ft.

Clay and gravel -----	80	80	Clay and blue clay -----	119	205
Gravel -----	6	86			

4N/9W-9N4. Mountain Brook Ranch. 14-inch casing 0-160 ft,
 perforated 60-140 ft. Altitude about 3,831 ft.

Sand, gravel, and boulders -----	26	26	Sand, clean, and gravel -----	7	116
Clay -----	51	77	Sand and clay -----	6	122
Sand and gravel -----	24	101	Sand and gravel -----	1	123
Sand -----	8	109	Sand, fine, and clay, cemented -----	37	160

Thickness (feet)	Depth (feet)	Thickness (feet)	Depth (feet)
---------------------	-----------------	---------------------	-----------------

4N/9W-9P1. Mountain Brook Ranch. Drilled by J. L. Clugage in 1957. 14-inch casing 0-200 ft. Altitude about 3,845 ft.

Rock, sand, and gravel -----	200	200
---------------------------------	-----	-----

4N/9W-10L1. Neas, formerly A. Laszloffy. Deepened from 145 to 249 ft by V. A. Reed in 1950. 8-inch casing 0-249 ft, perforated 132-163 ft, 175-182 ft, and 219-224 ft. Altitude about 4,145 ft.

No record -----	145	145	Clay, sandy -----	41	221
Clay, sandy, hard ----	15	160	Sand and gravel, probably water- bearing -----	1	222
Gravel, coarse, probably water- bearing -----	1	161	Clay, sandy, hard, packed -----	20	242
Clay, sandy -----	18	179	Clay -----	7	249
Gravel, coarse, probably water- bearing -----	1	180			

4N/9W-10M2. A. J. Krystosiak. Drilled by Hall to 150 ft, deepened to 424 ft by Berring in 1946. 12-inch casing 0-150 ft, 8-inch casing 150-416 ft, no casing 416-424 ft. Altitude about 4,115 ft.

No record -----	163	163	Hardpan -----	15	298
Hardpan -----	15	178	"Soft" -----	45	343
"Soft drilling" -----	45	223	Hardpan -----	18	361
Hardpan -----	15	238	"Soft" -----	63	424
"Soft" -----	45	283			

4N/9W-11J1. Gordon Lackerbie. Drilled by W. Barnett in 1960. 8-inch casing 0-410 ft, perforated 310-410 ft. Altitude about 4,400 ft.

Sand and clay -----	20	20	Clay and boulders ---	15	260
"G.D. hard" -----	70	90	Clay, brown -----	60	320
Boulders and hard clay -----	20	110	Clay and gravel, sandy -----	30	350
Hardpan -----	90	200	Clay and fine gravel -----	20	370
Clay, brown, sandy ---	20	220	Granite, decomposed, fairly hard -----	40	410
Hardpan -----	25	245			

Thickness (feet)	Depth (feet)	Thickness (feet)	Depth (feet)
---------------------	-----------------	---------------------	-----------------

4N/9W-14D1. John Coffeen. Drilled by J. L. Clugage in 1956.
10-inch casing 0-265 ft, perforated 150-265 ft. Altitude about 4,330 ft.

Gravel, fill, loose; clay and rocks -----	265	265	Granite, white-gray, "at bottom" -----	265
--	-----	-----	---	-----

5N/9W-4E1. C. Hall, formerly Louis Upshaw. Drilled by R. R. Rogers in 1955. 10-inch casing 0-315 ft, perforated 90-287 ft. Altitude about 2,881 ft.

			Sand, hard -----	165	1,200

APPENDIX E

TABLE 5. CHEMICAL ANALYSES OF WATER FROM WELLS

Table 5.--Chemical analyses of water from wells

Values for calcium preceded by the letter a indicate a combination of calcium and magnesium; values for sodium preceded by the letter b indicate a combination of sodium and potassium.

Analyzing Laboratory: AES University of California Agricultural Extension Service; DPH California Department of Public Health; DMR California Department of Water Resources; PC Los Angeles County Flood Control District; GS U.S. Geological Survey; IMD Los Angeles County Industrial Waste Division; PA Pomaroy and Associates, Pasadena, Calif.

Well number	Date of collection	Depth of well (feet)	Water temperature (°F)	Results in parts per million (ppm)																	pH	Specific conductance (micromhos at 25°C)	Analyzing laboratory and sample number	
				Silica (SiO ₂)	Iron (Fe)	Calcium (Ca)	Magnesium (Mg)	Sodium (Na)	Potassium (K)	Bicarbonate (HCO ₃)	Carbonate (CO ₃)	Sulfate (SO ₄)	Chloride (Cl)	Fluoride (F)	Nitrate (NO ₃)	Boron (B)	Calculated (Sum of determined constituents)	Residue on evaporation at 180°C	Hardness as CaCO ₃	Noncarbonate as CaCO ₃				Percent sodium

APPENDIX F

TABLE 6. CROSS INDEX OF STATE NUMBERS AND OTHER NUMBERS

TABLE 7. REFERENCES THAT CONTAIN WATER-LEVEL MEASUREMENTS
IN WELLS IN THE EASTERN PART OF THE ANTELOPE
VALLEY AREA, CALIFORNIA

Table 6.--Cross index of state numbers and other numbers

Table 6 lists the official state well numbers assigned to wells by the Geological Survey, cross indexed with the old numbers assigned to the well as follows: DWR California Department of Water Resources; FC Los Angeles County Flood Control District; J Johnson (1911); O owner; T Thompson (1929); and WRB California Water Rights Board. For well numbers assigned by the California Department of Water Resources prior to adoption of the uniform state well-numbering system, the township and range numbers and letters are omitted.

A lowercase letter preceding the well number indicates a footnote.

- a. The DWR number was obtained from FC data.
- b. Questionable correlation of wells.
- c. Questionable number.
- d. Well has been given a new number.
- e. The number has been used for more than one well.
